                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

This sequence represents a probe for the RT pol region of hepatitis b virus (HBV). This sequence can be used in the method of the invention for detection and/or generic analysis of hepatitis B virus (HBV) in a sample.

The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (I) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample, and amplifying the relevant part of a suitable HBV gene in the sample with at least 1 and the primer pair; (b) hybridising (I) with a combination of at least 2 nucleotide probes, which are applied to known locations on a solid 2 uncleotide probes, which are applied to known locations on a solid 2 uncleotide probes, which are applied to known locations on a solid 2 uncleotide probes, which are applied to known locations on a solid 3 cancype specific target sequences, or their complements or U for T comploques; (c) detecting the hybrids formed in step (B), and inferring the HBV genotype and/or mutuants present in the sample from the differential hybridisation signal (S). The composition can be used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, gene mutations selected by treatment with drugs, e.g. lamivudune and per gene mutations selected by treatment with drugs, e.g. lamivudune and per per proper precorne mutations to selected by treatment with drugs, e.g. lamivudune and per per proper precorne mutations and ST generic and selected by treatment with drugs, e.g. lamivudune and per per proper precorne mutations cornect OS field.)

Novel human epidermal growth factor-like molecule containing mucin-like hormone receptor-2 polypeptide, useful for treating acute and chronic inflammation, chronic tissue damages and for wound healing.

Example; Page 49; 118pp; English.

Containing mucin-like hormone receptor-2 (EMR2) proteins and nucleic acids encoding them. EMR2 sequences are useful for treating acute acids encoding them. EMR2 sequences are useful for treating acute inflammation caused by injury or infection (e.g. meningitis and premain acids encoding them. EMR2 sequences are useful for treating acute inflammation (e.g. rheumatoid arthritis), chronic inflammation (e.g. rheumatoid arthritis), chronic clissue damages, septic shock, atherosclerosis, repair and autoimmune disease processes, diabetes, Alzheimer's disease, processes such as medicion and effector mechanism of innate and acquired recruitment, induction and effector mechanism of innate and acquired autoimmunity. They are also useful for treating conditions involving clotting, fibrinolysis, intravascular coagulation, thrombosis and blood autoimmunity. They are also useful for treating conditions involving clotting, fibrinolysis, intravascular coagulation, thrombosis and compensation or deactivation of phagocytes, myeloid leukaemia, anemia, activation or deactivation of phagocytes, myeloid leukaemia, anemia, activation or deactivation of phagocytes, myeloid leukaemia, anemia, controlling atmour formation of phagocytes, myeloid leukaemia, anemia, controlling tumour formation of phagocytes, myeloid leukaemia, anemia, controlling tumour formation of granuloma. Sequences of the invention classic for treating macrophage controlling tumour formation or disease associated with EMR2 polypetide and in the preparation of a diagnostic agent for use in the method of diagnosis of condition or disease associated with EMR2 polypetide. Antibodies of the preparation of a diagnostic agent for use in the method of diagnosis of classic macrophage sections, particularly infections caused by thingal, proteonsion, acute heart failure, hypotrension, acute heart failure, hypotrension, and hand particularly mycoarders including anxiety, schizophrenia, mannic depression, and severe mental retardation, dyskinesias such as Huntington's disease or G patent discloses human epidermal growth factor (EGF)-like molecule

```
The patent discloses human epidermal growth factor (EGF)-like molecule containing mucin-like hormone receptor-2 (EMR2) proteins and nucleic acids encoding them. BMR2 sequences are useful for treating acute inflammation caused by injury or infection (e.g. meningitis and pneumonia), chronic inflammation (e.g. rheumatoid arthritis), chronic tissease processes, diabetes, Atherosclerosis, repair and autoimmune disease processes, diabetes, Atherosclerosis, repair and autoimmune climates and actoimmunity. Induction and effector mechanism of innate and acquired autoimmunity. They are also useful for treating conditions involving clotting, fibrinolysis, intravascular coagulation, thrombosis and autoimmunity. They are also useful for treating conditions involving choises such as aneutropenia, agranulocytosis, migration, retention activation or deactivation of phagocytes, myeloid leukaemia, anaemia, general disorders (connective tissue (e.g. vascular malfunction, wound healing) and congenital diseases such as hereditary haemorrhagic telangiectasia (HHT) and Marfan syndrome. They are also useful for

controlling tumour formation and metastasis, for treating macrophage giant cells in bacterially-induced granuloma. Sequences of the invention are useful in the preparation of a medicament for use in a method of therapy of a condition or disease associated with EMR2 polypeptide and in the preparation of a diagnostic agent for use in the method of diagnosis of a condition or disease associated with EMR2 polypeptide. Antibodies against EMR2 are useful for treating infections such as bacterial, city and viral infections, parkinolarly infections caused by HIV-1 or HIV-2, pain, cancers, parkinolarly parkinson's disease, bulimia, hypotension, acute heart failure, hypertension, osteoporosis, urinary retention, angina pectoris, myocardial infarction, ulcers, allergies, benign prostatic hypertensis, myocardial infarction, ulcers, allergies, benign prostatic hypertensis, manic depression, delirium, dementia, severe mental retardation, dyskinesias such as Huntingcon's disease or Gilles dela Tourette's syndrome. The present DNA sequence is a reverse transcription (RT)-PCR primer which is specific for human EMR2 Human, EGF-like molecule containing mucin-like hormone receptor-2; EMR2;

                                                            The patent discloses human epidermal growth factor (EGF)-like molecule containing mucin-like hormone receptor-2 (EMR2) proteins and nucleic containing mucin-like hormone receptor-2 (EMR2) proteins and nucleic containing mucin-like hormone receptor-2 (EMR2) proteins and nucleic containing mucin-like hormone are useful for treating acute inflammation caused by injury or infection (e.g. meningitis and classae processes, diabetes, Albeimer's disease, processes such as filing of targets by degranulation, chemotraxis and leukocyte recruitment, induction and effector mechanism of innate and acquired recruitment, induction and effector mechanism of innate and acquired cutoimmunity. They are also useful for treating conditions involving clotting fibrinolysis; intravascular cosquitation, thrombosis and chotting fibrinolysis; intravascular cosquitation, thrombosis and condism, wound repair and angiogenesis, hadmatopoissis and blood disorders of connective tissue (e.g. vascular malfunction, wound activation or deactivation of phagocytes, myeloid leukaemia, anaemia, cativation and cativation of phagocytes, myeloid leukaemia, northing activation or deactivation of phagocytes, myeloid leukaemia, northing cutoin or deactivation of a medicament for use in a method of controlling tumour formation and metastasis, for treating macrophage giant cells in bacterially-induced granuloma, Sequences of the invention are useful for treating infections such as bacterial, or the preparation of a medicament for use in a method of crease associated with EMR2 polypeptide and in the preparation of disease associated with EMR2 polypeptide and in the preparation of disease associated with EMR2 polypeptide and in the cutoin and viral infections, particularly infections caused by unimary retention, acute heart failure, hypertension, acute heart failure, hypertension, acute heart failure, hypertension, acute heart failure, hypertension, dementia, severe mental retardation, dyskinesias such as Huntington's disease, benign proteated the propersion of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
hormone receptor-2 polypeptide, useful for treating acute and chronic inflammation, chronic tissue damages and for wound healing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         듸
                                                                                                                                                                                                                                                                                                                            designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                     cleaves
                                                                                                                  New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves
RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,
PCNA and Cyclin B1.

                                                                                                                                                                                                                                                                      g
                                                      The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, anticlasborrheic, antidiabetic, antidiabetic, antidiabetic, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carchnoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing centing such as keloid, adhesion and hypertrophic or hypertrophic burn scar.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, vulnerary, keratolytic and virucide activities, and obthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cyckine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermathis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic watt. They can also be used for treating proliferative eye diseases such as diabetic
inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                      .;

The present invention relates to compositions and methods useful for the identification and detection of polycystic kidney disease (PKDI) gene mutations. The invention also relates to primers comprising a 5' region having a sequence that selectively hybridises to a PKDI gene sequence and coptionally, to a PKDI homologue sequence and an adjacent 3' region having a sequence that selectively hybridises to a PKDI gene sequence and not to a sequence that selectively hybridises to a PKDI gene sequence and not to a PKDI homologue sequence. Primer pairs of the invention are useful for detecting the presence or absence of a mutation in a PKDI polymucleotide in a sample, for identifying a subject at risk for a PKDI-associated disorder such as autosomal dominant polycystic kidney disease (ADPKD) or acquired cystic disease and for diagnosing a PKDI-associated disorder in a subject. They are useful for selectively amplifying a region of a PKDI gene. PKDI DNA fragments are useful detecting the presence of a mutant PKDI polymucleotide in a sample, as a probe for an amplification contact of the caction, in hybridisation or amplification assays of biological samples to an argument and for engineering transgenic the ansatt pkm, and the present sequence is a PCR primer used to detect mutation in the pares.
retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAHS/5777 to AAHS(2099 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel primer for diagnosing polycystic kidney disease-associated disorder, comprises regions having sequence that selectively hybridizes to polycystic kidney disease gene sequence.

```

Probe, hepatitis b virus; HBV detection; RT pol region; genetic analysis; preCore region; HBsAg region; genotype specific target; mutation detection; ss.

Synthetic. Hepatitis B virus.

WO9740193-A2

30-OCT-1997.

Probe HBPr276 for RT pol region of HBV.

(revised)
(first entry)

27-AUG-2003 19-MAY-1998

AAV14110;

```
This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV). This sequence can be used in the method comprises: (a) optionally releasing, isolating on a sample. The method comprises: (a) optionally releasing, isolating on a sample. Concentrating polymucleic acids (1) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample with at least 1 suitable primer pair; (b) hybridising (1) with a combination of at least 2 nucleotide probes, which are applied known locations on a solid support and hybridise specifically to mutant target sequences chosen from the HBV RT pol gene region, HBV preCore region, HBSAg region and/or HBV compogues; (c) detecting the hybridis formed in step (b), and interring the HBV genotype and/or mutants present in the sample from the differential hybridisation signal(s). The composition can be used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, sepecifically genotype, preCore mutations, vaccine escape mutations and RT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence represents a probe for the RT pol region of hepatitis b
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                lamivudune and

The HLA Class I gene is selected from among HLA-A, -B and -C genes. The method comprises of treating the tissue sample to obtain nucleic acid polymers suitable for amplification then combining these polymers with a first primer which hybridises with a portion of intron 1 or intron 3 of the HLA Class I gene and a second primer which hybridises with a different portion of the HLA Class I gene under conditions suitable for amplification to obtain an amplified product. The product is then evaluated to determine the Allelic type of the HLA-Class I gene. The method is useful for tissue matching HLA class I antigens between donors and recipients and hence for preventing graft versus host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA-based human leukocyte antigen class I gene typing method - useful for tissue matching and prevention of graft versus host disease.
                                                                                                                                                                                                                donor;

The invention relates to a method (I) for testing a tissue sample to determine the allelic type of a human leukocyte antigen (HLA) class I gene in the sample, where the HLA class I gene is selected from HLA-A, Gene in the sample, where the HLA class I gene is selected from HLA-A, in HLA-B or HLA-C, by: (a) treating the tissue sample to obtain nucleic acid polymers with a primer which hybridizes with a portion of intron 1 or intron 3 of the HLA class I gene, and a second primer which hybridizes with a different portion of the HLA class I gene and performing with a different portion of the HLA class I gene and performing in a policiation, where the primers flank a region including at least one site of allelic variation in at least one of exons 2 or 3 of the HLA class I gene and where the first primer is a locus specific primer which hybridizes with intron 1 or 3 of only one of the HLA class I gene and where the first primer is a locus specific primer which hybridizes with intron 1 or 3 of only one of the HLA class I genes; and consumption of a classical or non-classical HLA class I gene in the sample The method is useful for testing a tissue sample to determine the allelic type of a classical or non-classical HLA class I gene in the sample. The sequences AAAII039-AAII22 represent consensus sequences of introns and exons of the HLA genes and primers and probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Medicament; agonist; melanocortin receptor type 3; ACTH; PMN; MC3-R; adrenocorticotrophic hormone; neutrophil chemoattractant; antigout; polymorphonuclear cell; septic shock; skin disorder; antiarthritic;

```
Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Probe, hepatitis b virus, HBV detection, RT pol region, genetic analysis, precore region, HBSAg region, genotype specific target, mutation detection, ss.
                                                                                                                                                            The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor exceptor 1 (TNFR1), where the antisense compound inhibites expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1. e.g. a liver disease (such as heparitis, or liver injury) or a hyperproliferative disease (such as heparitis, or liver injury) or a hyperproliferative disease (such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for disquestics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a mouse oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection and/or genetic analysis of hepatitis B virus - specifically genotype, preCore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a probe for the RT pol region of hepatitis b

                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the use of a compound comprising an amino acid as equence His-Phe-Arg-Trp (HFRW) in the manufacture of a medicament and/or an agonist of melanocortin receptor type 3 (MC3-R) where the compound is not adrenocorticotrophic hormone (ACTH)1-39. The compounds are used to inhibit neutrophil chemoattractant production, polymorphomuclear cell (PMV) accumulation or reduction/treatment of inflammation. Especially, these compounds are agonists of the MC3-R. The inflammatory response/disease is selected from gout, gouty arthritis, rheumatoid arthritis, asthma, reperfusion injury or damage, stroke, myocardial infarction, septic shock, or a skin disorder. Sequences AA257073-80 represent PCR primers used for amplifying murine melanocortin receptors
 melanocortin receptor; anti-inflammatory; antiasmatic; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; mouse; murine; ds.

virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or a concentrating polymudicic acids (i) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample with at least 1 collected probes, which are applied to known locations on a solid support and hybridise specifically to mutant target sequences chosen from the HBV RT pol gene region, HBV PR complements or U for T chem HBV protector region, HBSAG region and/or HBV chomologues; (c) detecting the hybridis formed in step (b), and inferring the HBV genotype and/or mutants present in the sample from the HBV genotype and/or monitor HBV mutants and/or genotypes in a sample, collagnose and/or monitor HBV mutants and/or genotypes in a sample, specifically genotype, precore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs, e.g. lamivudune and penciclovir. (Updated on 27-AUG-2003 to correct OS field.)

Detection and/or genetic analysis of hepatitis B virus - specifically genotype, precore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs.

Claim 5; Fig 1; 80pp; English.

This sequence represents a probe for the RT pol region of hepatitis b virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (I) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample with at least 1

suitable primer pair; (b) hybridising (I) with a combination of at least 2 nucleotide probes, which are applied to known locations on a solid support and hybridise specifically to mutant target sequences chosen from the HBV RT pol gene region, HBV precore region, HBSAg region and/or HBV genotype specific target sequences, or their complements or U for T homologues; (c) detecting the hybridis formed in step (b), and inferring the HBV genotype and/or mutants present in the sample from the diagnose and/or monitor HBV mutants and/or genotypes in a sample, specifically genotype, precore mutations and/or genotypes in a sample, gene mutations selected by treatment with drugs, e.g. lamivudune and penciclovir. ```
The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1. PCNA and Cyclin B1.
Representative examples of Tibozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19 BP; 0 A; 3 C; 4 G; 12 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pritz R,
                                                                                                                                                                                                                                                    AAA85942
                                                                                                                                                        g
                                                                                                                                                                                                                                                                                  The invention provides a highly sensitive method for detecting variation of viruses using a 2-step polymerase chain reaction (nested PCR) regime. The method comprises: (1) amplification of a predetermined region of viral DNA in the first round of PCR; (2) treatment of the amplified of product with a restriction enzyme capable of cleavage of a product a second round of PCR using a primer designed to introduce a mismatch a second round of PCR using a primer designed to introduce a mismatch base, to form a restriction enzyme recognition site in the amplified product with a restriction enzyme capable of cleavage of the amplified product with a restriction enzyme capable of cleavage of the amplified product derived from the viral mutant, (4) treatment of the amplified product derived from the viral mutant, (5) detection of mutation of viruses by investigation of the restriction pattern. The method allows simple and highly sensitive detection of mutation in viral genomes using 2-step nested PCR method in a short period of time. Sequences AAX77255-263 represent PCR primers used for the detection of lamivadine resistant hepatitis B virus by the method of the invention. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                     The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1. PCKN and Cyclin B1. Representative examples of ribozyme recognition sites are given in RAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in

                                                                                                                                                                                                                                                                                                                                                         ij
                                                                                                                        The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1. FORA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in Inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatcological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, aquamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adiasion and hypertrophic or hypertrophic burn scarring such as keloid, adiasion and hypertrophic or hypertrophic burn scarring such as keloids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 19 BP; 1 A; 3 C; 4 G; 11 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           exemplification of the present invention

Example 1; Page 328; 408pp; English.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a

```
ribozyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn sear. The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in cill amation matrix metalloproteinase (MPM), cytolin, cell-cycle dependent kinase, growth factor or a reductase, or administering a concleic acid molecule (II) comprising a promoter operably linked to a concleic acid molecule (II) comprising a promoter operably linked to a concleic acid segment encoding [1]. ([1] can have antiposolatic, cophthalmological, vulnerary, keracloytic antidiabetic, antisickling, cophthalmological, vulnerary, keracloytic and virrode activities, and cleaves RNA encoding cytokine involved in inflammation. ([1] can be used (1] carcinome and viral or sebortheic wart. They can case therapy. ([1] and ([1] are useful for treating proliferative skin cleaves RNA encoding cytokine involved in inflammation. ([1] can be used ([2] carcinome and viral or sebortheic wart. They can case therapy. ([1] and ([1] are useful for treating proliferative skin case as socials of carcinome and viral or sebortheic wart. They can case therapy, virrecreting poliferative and in the relinopathy, virrecretinopathy, sickle cell retinopathy, retinopathy, virrecretinopathy, sickle cell retinopathy, virrecretinopathy, social design and hypertrophic or hypertrophic burn case semplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, originalis, cervicitis, allinguis, perinapatitis, bartholinitis; penumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorders associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                               Sequence 17 BP; 2 A; 5 C; 4 G; 6 T; 0 U; 0 Other;

Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.

Example 2; Page 228; 718pp; English

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV97875). HTPL and ABP9519 to ABP9520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-6 (\$ for short) compared to HTPL- (I for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar

÷ to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10p12.1 HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder sascotated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal livez, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention This invention describes novel tumor cells (I), with a combination of major histocompatibility (MHC) I and II genes occurring in humans. The tumor cells, tumor cell library or vaccine described in the invention can be used for the prophylaxis or treatment of tumor diseases. AAZ88790-Z88805 represent PCR primers used to amplify the human lymphocyte HLA molecules described in the method of the invention. ABK15582,
                                                                                                   The invention describes a substantially pure canine or feline melanocortin 4 receptor (MC4R) polypeptide (I). The polypeptide can be used in the treatment of appetite-related or metabolic disorders including cachexia, anorexia or weaning-induced inappetance and growth lag, diabetes, cancer, renal failure, cardiac disease, endotoxaemia, cever, hepatic lipidosis, infection or inflammation, in a post patrum sow, dairy cow, companion animal. livestock animal, poultry animal, obesse animal or a gravid animal. (I) is useful in the generation of contribodies, as reagents in diagnostic assays, identification of other cellular gene products involved in the regulation of appetite in animals, as reagents in assays for screening for compounds that can be used in the treatment of appetite disorders in animals. A ligand of MC4R is useful for elaborating the biological function of MC4R gene product and for ameliorating appetite disorders and metabolic disorders, in animals. This sequence represents the reverse primer used with primer ABK15584 to isolate feline and canine melanocortin 4 receptor (MC4R) clones, a G-protein coupled receptor described in the method of the invention
                                                                                                                                                                                                                                                                                                      Melanocortin 4 receptor; MC4R; G-protein coupled receptor; appetite; metabolic disorder; cachexia; anorexia; weaning-induced inappetance; growth; diabetes; cancer; renal failure; cardiac disease; endotoxaemia; fever; hepatic lipidosis; infection; inflammation; post partum sow; dairy cow; livestock; poultry; shipping stress; crowding stress; obesity; vaccine; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel canine or feline melanocortin 4 receptor polypeptide for screening modulator compounds useful for treating cachexia, anorexia, diabetes and

```
The invention describes a substantially pure canine or feline
melanocortin 4 receptor (MC4R) polypeptide (1). The polypeptide can be
used in the treatment of appetite-related or metabolic disorders
including cachexia, anorexia or wearing induced inappetance and growth

[19] diabetes, cancer, renal failure, cardiac disease, endotoxaemia,
[20] fever, hepatic lipidosis, infection or inflammation, in a post partum
[20] sow, dairy cow, companion animal, livestock animal, poultry animal,
[21] animal suffering from shipping or crowding stress, lactating animal,
[22] consea animal or a gravid animal. (1) is useful in the generation of
[23] antibodies, as reagents in diagnostic assays, identification of other
[23] callular gene products involved in the regulation of appetite in animals,
[24] cas reagents in assays for screening for compounds that can be used in the
[25] treatment of appetite disorders in animals. A ligand of MC4R is useful
[26] constants appetite disorders and metabolic disorders, in animals. This
[27] sequence represents the reverse primer used with primer ABK15581 to
[28] isolate felline and canine melanocortin 4 receptor (MC4R) clones, a G-
[26] protein coupled receptor described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

Sequences AAS56729-AAS56968 represent DNA encoding BRCA-1 regulators, ribozyme target recognition RNA sequences, DNA fragments encoding the RNA and primers used in the methods of the invention. Hybridisation of ribozymes to their targets results in cleavage of the RNA target. The ribozymes can be used to cleave regulators of the tumour suppressor BRCA-1, resulting in upregulation or downregulation of BRCA-1 in a cell. The mRNA targets include those encoding the BRCA-1 regulator BR1, inhibitor CHIRZ, AF6, BRZ and BR3. Regulation of BRCA-1 is useful for treating and diagnosing cancer and other proliferative disorders. The severity of an incleance of cancer can be lessened by regulating tumour proliferation through modulation of BRCA-1. The sequences of the invention are useful in the development of anti-cancer drugs
                                                                                                                    Human, BRCA-1 regulator, ribozyme, BR1, RNA target recognition, probe;

```

```
The present sequence is a probe used in a method for monitoring antihepatitis B virus (HBV) drug resistance in a patient by genetic detection of any one of mutations 1528M, M552V/I and/or V/L/M551 in HBV DNA polymerase in a biological sample from the patient. The method is useful in the field of genetic detection of anti-HBV drug resistance during HBV therapy. The method is rapid, reliable and precise
                                                                                                                                                                                                                               Monitoring anti-HBV drug resistance by genetic detection of mutations in DNA polymerase of HBV in patient's sample, involves hybridizing the polynucleic acids of the sample with a probe and detecting the hybrid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The chard structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL gene was important in regulating male germ cell development, and the HTPL gene was mappered to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, andlt and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                         Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, gene therapy, tumour suppressor, HTPL, chromosome 10p12.1; human testis sypressed Patched like protein, testis, adrenal, liver, humen germ cell development, bone marrow, brain; kidney, lung, placenta, prostate, skeletal muscle, colon, male infertility, cancer; ss.

The present invention relates to human testis expressed Patched like correct invention relates to human testis expressed Patched like brotein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL constructions, with a few single base pair changes introduces a premature stop codon in HTPL-8 (S for short) compared to HTPL-10. Life long). HTPL codon in HTPL-8 (S for short) compared to HTPL-10. Life long). HTPL codon in HTPL-8 (S for short) compared to HTPL-10. Life long). HTPL codon in HTPL plays a role similar content of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome lopiz.1. HTPL and its coding sequence are consequent for diagnosting a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture with decreased expression or activity of human HTPL. Such disorders include disorders expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foctal liver, bone marrow, brain, kidney, lung, placenta, prostate, colinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Leucocyte derived growth factor 2; mitigenic; chemotactic; PDGF; receptors; platelet derived growth factor; coagulation; inflammation; immune response; cell growth; coagulation; amplification; ss.

                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                          ö
                                                                                                                                          The sequence is that of a PCR primer used for the amplification of a leucocyte derived growth factor 2 having mitogenic and/or chemctactic activity. LDGF2 reacts with PDGF receptors and can be used in wound healing, coagulation, inflammation, immune responses and cell growth. See also AAQ69162-73. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a probe for the RT pol region of hepatitis b virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (1) in the sample, and amplifying the selevant part of a suitable HBV gene in the sample with at least 1 suitable primer pair; (b) hybridising (1) with a combination of at least 2 nucleotide probes, which are applied to known locations on a solid
                                                       New leukocyte derived growth factor 2 - having mitogenic and/or chemotactic activity, partic. for connective tissue cells, used esp. for

the HBV RT pol gene region, HBV precore region, HBSAg region and/or HBV genotype specific target sequences, or their complements or U for T homologues; (c) detecting the hybrids formed in step (b), and inferring the HBV genotype and/or mutants present in the sample from the differential hybridisation signal(s). The composition can be used to specifically genotype, Precore mutants and/or genotypes in a sample, specifically genotype, Precore mutantions, vaccine escape mutations and RT gene mutations selected by treatment with drugs, e.g. lamivudune and penciclovir. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a probe for the RT pol region of hepatitis b virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polymucleic acids (1) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample with at least 1 suitable primer pair; (b) hybridising (1) with a combination of at least 2 nucleotide probes, which are applied to known locations on a solid support and hybridise specifically to mutant target sequences chosen from the HBV RT pol gene region, HBV precore region, HBSA; region, HBSA; region and/or HBV genotype specific target sequences, or their complements or U for T homologues; (c) detecting the hybrids formed in step (b), and inferring the HBV genotype and/or mutants present in the sample from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Probe, hepatitis b virus, HBV detection, RT pol region, genetic analysis, preCore region, HBsAg region, genotype specific target, mutation detection, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection and/or genetic analysis of hepatitis B virus - specifically genotype, preCore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs.
                                                                                                                                                                                                                                                                                                                                    Gaps

The methods are useful for detecting the presence of the TRC8 gene in a biological sample, detecting alterations to the gene, such as a 3;2 human chromosomal translocation, and fused DNA for detecting the 3;8 human chromosomal translocation, by contacting the nucleic acid probe with a biological sample to be tested, and determining whether the nucleic acid probe with a biological sample to be tested, and determining whether the nucleic acid probe specifically hybridises to the TRC8FHIT or FHIT/TRC8 fusion DNA. This polynucleotide sequence represents a TRC8 related PCR primer of the invention

differential hybridisation signal(s). The composition can be used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, specifically genotype, precore mutations, vaccine escape mutations and gene mutations selected by treatment with drugs, e.g. lamivudune and penciclovir.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a polypeptide (which is the product of the expression in a host cell of a DNA) TRC8 (Translocation in Renal Cancer from Chromosome 8). Also included are a polypeptide product of the expression in a host cell of a DNA, comprising (a) culturing a host cell of a DNA, comprising (a) culturing a host cell opolypeptide comprising TRC8 and (b) recovering the polypeptide. The gene encoding TRC8 is located in the chromosomal translocation region t(3;8), resulting in a fusion with the fragile histidine triad gene, FHIT. This region id associated with renal and thyroid tumours (especially renal call carcinoma, RCC). The polypeptide is useful for diagnosing tumours, particularly for determining if the TRC8 gene is expressed in samples. The present sequence is an single-stranded conformational polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New TRC8 (Translocation in Renal Cancer from Chromosome 8) polypeptide, useful for diagnosing tumors, particularly for determining TRC8 gene expression in samples.

A265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AA265579 to AAA7740 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention can are genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel biallelic markers used to construct a high density disequilibrium

A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to
                                                                                                                                                                                                                                                                                                                                             Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated human testis expressed Patched like protein (HTPL), useful
                                                                                                                                         The present invention provides oligonucleotides, and methods for their use, which are useful in modulating the action of proteins involved in gastric acid production. The target protein is preferably the histamine Hz receptor or one of the proteins which form part of the gastric protein pump. The sequences and methods of the invention are useful in the treatment of gastric reflux, gastritis, dyspepsia, stomach ulcers, duodenal ulcers and other gastric acid disturbances, most of which are caused by Helicobacter pylori
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, gene therapy, tumour suppressor, HTPL, chromosome 10p12.1; human testis expressed Parched like protein, testis; adrenal; liver, male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.
                                                                           Treating gastric acid disturbance by administering an oligonuclectide which modulates the activity of a polypeptide involved in gastric acid production or secretion.
                                                                                                                                                                                                                                                                               Gaps

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL have isoforms, with a few single base pair differences between the cut. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the patched protein. The shares an overall structure organisation with the patched protein. The codon in HTPL-S and is a potential tumour suppressor. HTPL gene was important in regulating male germ cell development, and the HTPL gene was compared to human chromosome 10pl2.1. HTPL and is coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and fortune in the inverse of colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an account of an analysis of analysis of an analysis of an analysis of an analysis of an analy

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal alloament, at least 80 % identity to the 17 mer sequence that of any of them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic caids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the production of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alaheimer's disease and central analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diseases. The polypeptides can also be used to generate antibodies, and

with tumour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligomucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; se.

```
and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-claaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                         ö

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HVV) or Hepatitis B virus (HVV) and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene archive and expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, inozyme, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                    Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; andxzwme; inozyme; zinzyme; amberzyme; G-Cleaver ribozyme; decoy molecule; aptemer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; dirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 68 identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies or viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides and polypeptides can be used to screen for their specific interactive molecules, and also be used to screen for their specific interactive molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Probe, hepatitis b virus, HBV detection, RT pol region, genetic analysis, preCore region, HBSAg region, genotype specific target, mutation detection, ss.
                                                                                                                                                                  New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 17 BP; 6 A; 4 C; 5 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic molecules include antisense and enzymatic nucleic acids such as hammerada ribozymes, DNAzymes, anceid acoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and MBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression of HBV genes and MBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                                                                                                                                                        Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This sequence represents a probe for the RT pol region of hepatitis by virus (HBV). This sequence can be used in the method of the invention for detection and/or generic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (I) in the sample, and amplifying the concentrating polynucleic acids (I) in the sample with at least 1 suitable primer pair; (b) hybridising (I) with a combination of at least 2 nucleotide probes, which are applied to known locations on a solid support and hybridises specifically to mucant rarget sequences chosen from the HBV RT pol gene region, HBV procore region, HBSAg region and/or HBV genotype specific target sequences, or their complements or U for T complements (c) detecting the hybrids formed in step (b), and inferring the HBV genotype and/or mutants present in the sample from the differential hybridisation signal (s). The composition can be used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, gene mutations selected by treatment with drugs, e.g. lamivudune and pencicleovir. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Probe; hepatitis b virus; HBV detection; RT pol region; genetic analysis; preCore region; HBsAg region; genotype specific target; mutation detection; ss.

This sequence represents a probe for the RT pol region of hepatitis b virus (HBV). This sequence can be used in the method of the invention for detection and/or generic analysis of hepatitis B virus (HBV) in a sample.

The method comprises: (a) optionally releasing, isolating or concentrating polymucleic acids (I) in the sample, and amplifying the concentrating polymucleic acids (I) in the sample, and amplifying the cultable primer pair; (b) hybridising (I) with a combination of at least 1 suitable primer pair; (b) hybridising (I) with a combination of at least 2 uncleotide probes, which are applied to known locations on, a solid consport and hybridise specifically to metent target sequences chosen from the HBV RT pol gene region, HBV precore region, HBAG region and/or HBV genotype specific target sequences, or their complements or U for T changouse; (c) detecting the hybrids formed in step (D), and inferring the HBV genotype and/or mutants present in the sample from the differential hybridisation signal (S). The composition can be used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, confice stationally genotype, precore mutations, vaccine escape mutations and RT generalizally genotype, precore mutations, vaccine escape mutations and RT generalizally contract on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   °
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated HIV-1 Group O env polypeptides - used for the detection of anti-HIV antibodies and for the production of antibodies for use in detection, purification and therapy.

change at the capture reagent site on the strip wherein the capture reagent for HIV-1 group O comprises a polypeptide shown in AAY06997-80 and AAY06993-84, and that for HIV-1 group M comprises a polypeptide shown in AAY06992, and that for HIV-2 comprises the polypeptide shown in AAY06991. The invention is used to screen patients for antibodies to HIV-1 types O and M, and HIV-2. The invention will be particularly useful in places and situation where equipment and/or electricity is not available. The invention provides a screening method which is faster and requires less equipment than prior art methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotconin member 4 (SLC644) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC644 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Solute carrier family 6 neurotransmiter transporter; sectonin 4; SLC6A4; genotyping; allele specific oligonuclectide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 9 gene for identifying drugs for treating disorders related to expression

The invention relates to a rapid assay for simultaneous detection and differentiation of antibodies to HIV-1 groups O and M, and HIV-2. The method comprises (a) contacting the sample with a strip containing at least one immobilised capture reagent per analyte and on which the sample moves from the proximal to the distal end by capillary action, under conditions sufficient to form capture reagent/analyte complexes, and (b) determining the presence of analyte(s) by detecting a visible colour

                                                                                                                                                                                                                                                                                                                                                                                                                              Primer I (507-32) is based on amino acids 5-10 of an isolated peptide (AAN16546) of a 50 kDa cellulase (AAN16543) of Melanocarpus albomyces ALKO4237. It was used with primer 2 (AAT66548) to amplify the 50K-cellulase gene (AAT66542) by PCR using ALKO4237 genomic DNA as template. The enzyme is useful for bio-stoning and bio-finishing cotton fabrics. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     KDR, hammerhead ribozyme, hairpin ribozyme, cleavage, rumour angiogenesis, psoriasis, rheumatoid arthritis, ocular disease, fms-like tyrosine kinase 1, kinase insert domain containing receptor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotronin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 50%-cellulase; endoglucanase; bio-stoning; bio-washing; denim; detergent; textile; pulp; paper; Melanocarpus albomyces; Myriococcus albomyces;

                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                            The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67575 to AAX75782 represent specific examples of nucleic acid molecules from the present invention
                                                                                  mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, gene therapy; tumour suppressor; HTPL; chromosome 10p12.1; human testis expressed Patched like protein; testis; adrenal; liver; male germ cell development; bone marrow; brain; kidney; lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.
                                                                                 Nucleic acid molecule modulating VEGF receptor(s) gene expression or stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV7875 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (Sior short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was majortant in regulating male germ cell development, and the HTPL gene was important in regulating a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of course disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foctal liver, bone marrow, brain, kidney, lung, placenta, prostate, skelled muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to a novel isolated 17 mer mucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated mucleic acids, e.g. as one cidentifying, quantifying and/or amplifying a mucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the mucleic acids, polypeptides, vectors containing the mucleic acids, cells containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                           This sequence represents an isolated nucleic acid sequence associated with tumour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80% identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to the coding sequence of human Creaml, which is a protein containing a repetitive 86 amino acid motif. The protein is a transcriptional control factor, and is a conjugate of retinoblastoma protein (Rb). The present sequence is the an intron-exon junction in the coding sequence of the invention
patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynuclectide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention

They were used with antisense primers (AAT16995-99) complementary to the 3' end of the sequence for the RT-PCR amplification of tick salivary gland mRNA. Parrial cDNA clones were obtd. and used to screen a cDNA library to obtain a full-length cDNA clone (AAT16988) coding for E-Dex

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fl-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, pocular diseases, psoriasis and rhematoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                  gene expression or mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide array, genotyping, single base extension reaction, SBE; PCR primer; polymorphic locus, single nucleotide polymorphism, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lockhart DJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                      The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to polymorphic locus in a sample e.g. a single nucleotide polymorphic locus in a sample e.g. a single nucleotide the method of the present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample in a SBE amplified nucleic acid product is then used as a template in a SBE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     reaction with an extension primer. The SBE reaction products are used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.
along with locus-specific tagged oligonucleotides useful in genotyping

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a gene from a high temperature-resistant coryneform microbe that encodes a heat-resistant lysin biosynthetic enzyme. The enzyme has aspartate-semialdahyde dahydrogenase activity can be used for growing amino acid-producing microbes. The present sequence is a primer which was used to amplify DNA encoding a heat-resistant lysin biosynthetic enzyme of the invention

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (AB180512-AB18109) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals
                                                                                                                                                                                                                                      Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ4; MDZ4; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer;

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD212, MD212. MD23 is concoded at chromosome 7422.1, MD24 is encoded at chromosome 6721.3-22.2, MD27 is encoded at chromosome 6721.3-22.2, MD27 is encoded at chromosome 6721.2 and MD212 is encoded at chromosome 572.3 and MD212 sequences are useful in therapy, or immunifacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212, or MD212. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as

                                                                                                                                                                                                                                                                                                                                                                                             ò
                                            The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7422.1, MD24 is encoded at chromosome 672.1.3-22.2, MD27 is encoded at chromosome 672.1.3-22.2, MD27 is encoded at chromosome 1601.2 and MD212 is encoded at chromosome 1601.2 and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are protein are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HRR2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.

                                                                                                                                                                                                                      The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nuclectide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain operatial hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their contain cuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as to increasing probrance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo

```
The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis of virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential cribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatitis c virus (HCV) infection, other infectious diseases, autoimmune diseases, and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological; cardiant; virucide, ophthalmological; keloid; skin disorder, Insulin-like Growth Factor I receptor; IGFP-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba, keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; skin cancer; sclerotic disease;

Example

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisorders. The method comprises contacting the skin with an receptor, IGP binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, of inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the artisense oligonucleotide is useful for ameliorating the effects of psoriasis, passing in the method is useful for ameliorating the effects of psoriasis, nechthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hypernecvascular condition such as a neovascular condition of the retina, brain or skin, growth factor—mediated malignancies, other sclerotic disease, kidney disease, hyperplasia
UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

(MURD-) MURDOCH CHILDRENS RES INST.

Edmondson SR;

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomuclectide which can be used to design the antisense oligomuclectides of the present invention (see AAF45151 and AAF45153-6150muclectides of the present invention (see AAF45151 and AAF45153-6160thyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, inhoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                 disease, kidney disease, hyperprivessels or any other hyperplasia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin cof (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or condition associated with HCV infection in conjunction with one or more a condition associated with HCV infection in conjunction with one or more a condition alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequence and substrate the sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequence.
                                                                                                                                                                                                                                                                                                      0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a consensus sequence of methanol regulated promoters of methylotrophic yeast. The specification describes 5' regulatory sequences within the alcohol oxidase I (AOXI) promoter region. AOXI catalyses the oxidation of methanol to formaldehyde. The AOXI promoter is an inducible promoter, primarily induced by methanol and starvation, and repressed in response to glucose and ethanol. The AOXI sequences can be used to produce expression cassettes and vectors, which are useful for protein production. The regulatory sequences are useful for protein production. The regulatory variety of host cells, in a research setting to further characterize promoter function and to study peroxisome biogenesis. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Yeast, alcohol oxidase 1; AOX1; AOX2; promoter; formaldehyde; methanol; protein production; peroxisome biogenesis; ss.
                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a probe used in a method for monitoring antihepatitis B virus (HBV) drug resistance in a patient by genetic detection of any one of mutations L528M, M552V/I and/or V/LLM555I in HBV DNA polymerase in a biological sample from the patient. The method is useful in the field of genetic detection of anti-HBV drug resistance during HBV therapy. The method is rapid, reliable and precise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Monitoring anti-HBV drug resistance by genetic detection of mutations in DNA polymerase of HBV in patient's sample, involves hybridizing the polynucleic acids of the sample with a probe and detecting the hybrid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HBV; hepatitis B virus; DNA polymerase gene; anti-HBV drug resistance; mutation detection; probe; ss.

The invention describes a novel isolated polymuclectide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for colony stimularing factor I receptor (CSFIR) gane, found on The colony stimularing factor I receptor (CSFIR) gane, found on The polypeptide are useful for improving the discovery and development of drugs for treating diseases associated with CSFIR activity, e.g., and inflammatory discorders and the haplotypes can be used to validate CSFIR as a candidate target for treating a specific condition or disease predicted to be associated vith CSFIR activity. Genotyphing the CSFIR gene of an individual can also be used in studying the expression and function of CSFIR, and in colony of the variation on the biological activity of CSFIR, and in studying the expression and function of CSFIR, and in the variation on the biological activity of CSFIR, as well as on the binding affinity of candidate drugs targeting CSFIR, Antibodies are useful in a variety of diagnostic and prognostic formats and therapeutic methods. A transgenic animal is useful in studying expression of the cSFIR isogenes in vivo, for in vivo screening and testing of drugs care useful against CSFIR protein, and for testing the efficacy of therapeutic agants CSFIR protein, and for testing the efficacy of therapeutic agants CSFIR protein, and for assaying a polymorphism in the target region. Without requiring any a priori knowledge of the phenotypic effect of any particular CSFIR or haplotype the invention provides a method for identifying lead compounds that are more likely to show efficacy in clinical trials. This sequence is an allele specific coligonucleotide primar used for detecting CSFIR gene polymorphisms, coligonucleotide primar used for Novel polymorphic variants of colony stimulating factor I receptor useful in studying expression and function of the protein, useful for screening candidate drugs to treat diseases e.g. inflammatory disorders. BP.

The invention relates to haplotyping the protocadherin 2 (PCDH2) gene, comprising determining which of the haplotypes given in the specification defines one or both copies of the individual's proble gene. The polymorphisms are within a 30244 base pair sequence (ABA05413), fully defined in the specification. The polymorphic variants are useful in studying the expression and function of FCDH2, in expressing PCDH2 contains for candidate drugs to treat diseases such as cancer, related to PCDH2 activity, in studying the effect of the variation on the biological activity of PCDH2 and the binding affinity of variation on the biological activity of PCDH2 and the binding affinity of variation on the biological activity of PCDH2 and the binding affinity of variation of the biological activity of PCDH2 and the binding affinity of validating PCDH2 as candidate target for treating a specific condition or disease associated with PCDH2 activity or in the condition or disease associated with PCDH2 activity. The present sequence is that of a PCDH2 allele-specific oligonucleotide (ASO) PCR primer of New protocadherin 2 (PCDH2) polymorphic variants and encoding genes, useful in expressing PCDH2 protein for screening candidate drugs to treat diseases related to PCDH2 activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tinis invention describes novel derivatised solid supports of rormula S'-L' -Z-CH2CH2-R, where: S' = a solid support; in = a bond or an (in) organic linker; Z = SO2 or S-S; R = dH, an H-phosphonate, alkanephosphonate, phosphortiester, phosphoramidite diester, phosphoration or modified nucleotide (N'), or an optionally substituted or modified nucleotide (N'), or an optionate, phosphorate, alkanephosphorate, phosphoritester, phosphorited (Triseter, phosphorate, phosphorotiditate, phosphorotical or phosphoramidate or phosphoramidite group, OH, ORI, SRI or optionate, alkanephosphonate, phosphorotidister, phosphorotidister, phosphorotidister, phosphoramidate or phosphoramidate, phosphorotidithidate, phosphoramidates, a substitutional or phosphoramidate, phosphorotidithidate, phosphoramidates, a process for preparing an oligonucleotide 5'-phosphate, a process for preparing an oligonucleotide 3'-diphosphate. The claying or phosphate, a process for preparing an oligonucleotide 3'-diphosphate. The claying conjugates, e.g. with anticancer drugs or viral (e.g. HIV) DNActargeting conjugates, e.g. with anticancer drugs or viral (e.g. HIV) DNActargeting conjugates, e.g. with anticancer drugs or viral (e.g. HIV) DNActargeting conjugates, e.g. with anticancer drugs or viral (Equation 16-OCT-COCT) or phosphates is simple and suitable for use in automatic DNA synthesisers. This sequence represents a fragment of the HIV-1 provirus genome, used to describe the method of the invention. (Updated on 16-OCT-COCT)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel derivatised solid supports of formula S'-L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS;
                                                                                                                                                                                                                                                                                                                                                            Derivatised solid supports and reagents for oligo:nucleotide synthesis and new oligo:nucleotide phosphoramidate conjugates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 trepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and oycosine methylation status in chemically pretraeted genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but fire wipo.int/pub/published_pct_sequences

Claim 1; SEQ ID NO 294552; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic

acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and oytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABC0010-ABE99989, ABC0010-ABE99989 and ABI0010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at 0

                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH9989 and ABI00010-ABH82073 the prepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF99899 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but fur wipo int/pub/published_pct_sequences
oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99899, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

ö This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at Gaps . 0 40.0%; Score 8.8; DB 1; Length 13; 83.3%; Pred. ```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABE99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but twipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraeted genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metaboolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99899, ABF00100-ABF99899, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genemic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABE99989, ABF00010-ABE99989 and ABI00010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABR00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.

Claim 1; SEQ ID NO 87427; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABI82073 trepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
